January - 2006

***Sub:*Installation of additional cooling facility for Furan No-Bake molding line**

Magna is happy to announce the installation of additional sand cooling facility for its Furan No-Bake molding line.

This sand cooling facility consists of a cooling tower, cooler classifier and PLC controls for accurate control of sand temperature. This facility along with the available cooling system will ensure adequate cooling of the reclaimed sand, which is re-used for molding.

This facility was formally inaugurated by **Mr. Peter Laube, Managing Director, Regeltechnik Kornwestheim GmbH, Kornwestheim, Germany** on 25th January 2006.

This facility will control the temperature of reclaimed sand within a narrow range. With this Magna will be able to re-use more amount of sand and more friendly work environment for our operators apart from improving the quality levels and surface finish of the castings produced.

This new facility helps Magna to reach another milestone to become a global benchmark for Furan No-Bake Molding systems and enable Magna to serve its customers better by providing good quality

products with excellent surface finish.
